Class 8: Breast Cancer Mini-Project

Arshiya Zarmahd (PID: A16247996)

About

In today's lab we will work with fine needle aspiration (FNA) of breast mass data from the University of Wisconsin.

Data Import

```
wisc.df <- read.csv("WisconsinCancer.csv", row.names = 1)
head(wisc.df)</pre>
```

 ${\bf Q1.\ How\ many\ observations/patients/individuals/samples\ are\ in\ this\ dataset?}$

nrow(wisc.df)

[1] 569

```
Q2. How many of the observations have a malignant diagnosis?
  # 1 way to do this is:
  sum(wisc.df$diagnosis == "M")
[1] 212
  # Another way to get this value is:
  table(wisc.df$diagnosis)
 В
     Μ
357 212
     Q3. How many variables/features in the data are suffixed with _mean?
  ncol(wisc.df)
[1] 31
  colnames(wisc.df)
                                "radius_mean"

[7] "concavity_mean" "concave.points_mean" "symmetry_mean"
[10] "fractal_dimension_mean"</pre>
```

Initial Analysis

Before analysis, I want to take out the expert diagnoses column (aka, the answer) from our dataset.

```
diagnosis <- as.factor(wisc.df$diagnosis)
head(diagnosis)

[1] M M M M M M
Levels: B M

wisc.data <- wisc.df[,-1]</pre>
```

Clustering

We can try kmeans() clustering first.

```
km <- kmeans(wisc.data, centers=2)
table(km$cluster)</pre>
```

1 2 131 438

Cross-Table

table(km\$cluster, diagnosis)

diagnosis

B M

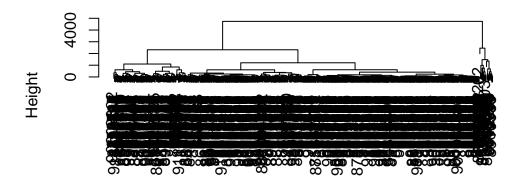

1 1 130

2 356 82

Lets try hclust(). The key input required for hclust() is a distance matrix as produced by the dist() function.

```
hc <- hclust(dist(wisc.data))
plot(hc)</pre>
```

Cluster Dendrogram

dist(wisc.data) hclust (*, "complete")

PCA

Do we need to scale the data?

We can look at the standard deviation of each column (original variable).

round(apply(wisc.data, 2, sd))

```
radius_mean
                                                           perimeter_mean

```

Generate our main PCA plot (score plot, PC1 vs PC2 plot).

```
library(ggplot2)

res <- as.data.frame(wisc.pr$x)

ggplot(res) +
   aes(PC1, PC2, col=diagnosis) +
   geom_point()</pre>
```

Combining Methods

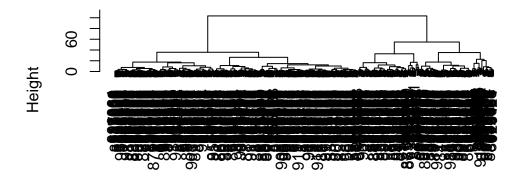

Clustering on PCA results

```
d <- dist(wisc.pr$x[,1:3])</pre>
```

Using the minimum number of principal components required to describe at least 90% of the variability in the data, create a hierarchical clustering model with the linkage method="ward.D2". We use Ward's criterion here because it is based on multidimensional variance like principal components analysis. Assign the results to wisc.pr.hclust.

```
d <- dist(wisc.pr$x[,1:3])
hc <- hclust(d, method="ward.D2")
plot(hc)</pre>
```

Cluster Dendrogram

d hclust (*, "ward.D2")

To get my clustering result/membership vector, I need to "cut" the tree with the cutree() function.

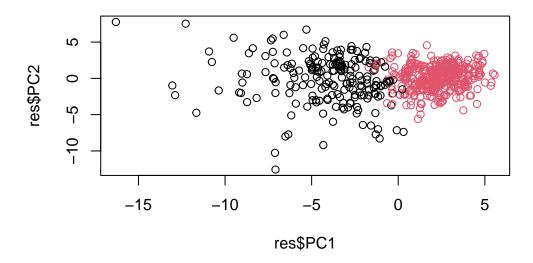

```
grps <- cutree(hc, k=2)</pre>
```

Q. How many patients are in each cluster group?

```
table(grps)

grps
    1    2
203 366

plot(res$PC1, res$PC2, col=grps)
```

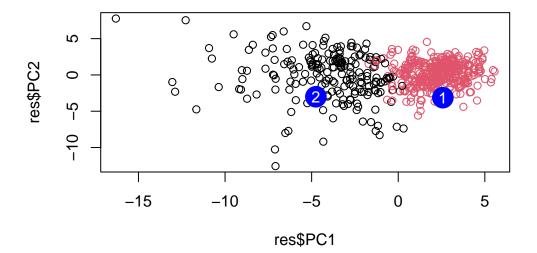

Prediction

We can use our PCA result (model) to do our predictions. That is, take new unseen data and project it onto our new PC variables.

```
#url <- "new_samples.csv"
url <- "https://tinyurl.com/new-samples-CSV"
new <- read.csv(url)
npc <- predict(wisc.pr, newdata=new)
npc</pre>
```

```

Summary

Principle Component Analysis (PCA) is a super useful method for analyzing large datasets. It works by finding new variables (PCs) that capture the most variance from the original variables in your dataset.
